

assysITAM:IT Automation

Axios™ IT Automation

SYSTEMS

Drive efficiencies and mitigate risks with automated IT Asset Management

assysITAM enables you to administer a variety of critical and often time consuming tasks, all from one centralized location. It supports Power Management for your Windows devices, which generates substantial cost and energy savings for your organization, whilst also providing greater control and visibility over Patch Management from an intuitive user interface. assysITAM allows you to easily deploy operating systems, software and execute scripts remotely to your Windows devices, and also has the ability to uninstall software. You can stay up-to-date and informed on all automation tasks through customizable notifications and alerts.

Patch Management

Gain full visibility and greater control over your Windows and Linux Security patches. A high-level dashboard gives you an overall view of your environment, highlighting the number of patches or service packs present or missing. Schedule a scan for missing patches or run a scan on demand. Drill down for more details such as the severity, size and status of the patch, even the links to the knowledge article for each patch. Automate the automatic approval and deployment of patches if desired.

Software Installation

Create MSI and Executable packages for quick and easy deployment to your Windows devices. Deploy by node, OU or at domain level silently at a time that suits without user intervention.

Script Execution

Deploy and execute scripts in a variety of formats (BATCH files, VB scripts and BASH files) to Windows and Linux environments. Script execution can be scheduled to run on a reoccurring basis if required.

OS Deployment

Reduce the turnaround time and eliminate the associated costs of shipping equipment back to your main site for re-imaging by deploying the OS remotely to the device. Create custom images tailored to your organization's needs.

Power Management

Power Management is often overlooked, when deployed it enables you to optimize energy costs. assysITAM allows you to easily create power policies to suit your needs without the use of complex coding. You can schedule and deploy these policies at times to suit you, with minimum interruptions to users.

IT Automation Highlights

- Greater control and visibility over Patch Management
- Quick and simple deployment of MSI and Executable software packages
- Ability to uninstall both MSI and non-MSI based software
- Faster turnaround for re-imaging Windows devices
- Capabilities which facilitate efficient Power Management

Benefits of IT Automation with assystITAM

- **Save money while helping the environment**

Take control of Power Management and deliver quantifiable cost savings, whilst empowering your organization to be environmentally responsible by reducing your carbon footprint and extending the lifespan of IT assets.

- **Mitigate risk with increased security and compliance**

Security threats are a continuous concern for organizations around the globe. Automate Patch Management to address vulnerabilities and provide a higher level of security and compliance, reducing the risk of a security breach and associated problems, such as data theft, loss of data or legal penalties.

- **Drive efficiencies in your ITAM practice**

Reduce deployment time and effort through automated OS Deployment, paving the way for standardized operating systems across the organization, thereby, reducing the support, training and management costs in maintaining them.

- **Greater control over deployments within your environment**

Create your own software repository of approved software and scripts and easily control what is deployed and when. Stay in control by tracking the installation status and receiving notifications when tasks are complete.

Patch management

IT SERVICE MANAGEMENT & IT ASSET MANAGEMENT SOLUTIONS

"I&O leaders that need to deliver IT services more proactively, on schedule and under budget should make the IT process automation (ITPA) discipline a central strategic pillar."

Gartner,
 "Six Steps to Move IT Process Automation From Basics to Best Practices",
 Robert Naegle, Ronni J. Colville, 7 August 2014

"Effective patch management programs mitigate risk by eliminating ad hoc, domain-specific activities and applying standard processes across all enterprise systems."

Gartner,
 "Improve Patch Management by Assessing Maturity and Applying Best Practices to Your IT Systems",
 Ronni J. Colville, 27 February 2013

Axios Systems provides service management solutions to large organizations worldwide. Axios's Enterprise Service Management software, assyst, is designed through customer-driven, agile development to support people, processes and technology. assyst was created to deliver simple yet powerful service management software that's easy to use and maintain. Axios Systems is a global company with offices across the Americas, Europe, Middle East and Asia Pacific. For more information about Axios Systems, visit www.axiossystems.com
